

# Phos-For-Rust

## Rust Converter and Metal Undercoating

HDH's Phos-For-Rust is a fast-acting rust eliminator. In use it is simply brushed on the rusty surface and instantly it goes to work converting the rust to a paintable surface.

To use:

1. Remove loose rust scales, loose paint, dirt and grease. Tight rust does not need to be removed.
2. Apply Phos-For-Rust by brushing, spraying or wiping. (If sprayed, do not breathe mists.)
3. Let dry. (Overnight is best.) If rust is extremely heavy a second coat may be necessary. Treated surface will appear dark gray to black.
4. A white power residue may develop. Brush off residue, paint surface.\*

NOTE: Rinsing the surface of the metal and letting dry is advisable but not necessary.

**Phos-For-Rust** is best applied when the temperature is above 70°F. If the temperature is below 70°F the reaction will be slower. The Tractor seat to the left had been exposed to the elements for several years. One half was treated with **Phos-For-Rust** and within 15 minutes the rust had been completely converted. The photograph was taken 3 days later, after the seat had been exposed to two rain showers. It was still ready to paint.

- **Phos-For-Rust** is fast acting.
- **Phos-For-Rust** is easy to use.
- **Phos-For-Rust** is economical.
- **Phos-For-Rust** acts as a painting primer.
